

# Matobev — Launch Budget

First release · Kenya · all figures in Kenyan shillings

Prepared for Simeon Odhiambo · Date 20 August 2026

Exchange rate KES 134 = USD 1 (mid-market 129.5 plus ~3.5% Kenyan card FX markup — you pay the card rate, not the mid-market rate)

|                                                                                                                           |                                                                                                          |                                                                                               |

## A · Legal and registration — one-off

| Item                                | KES    | Status                                         | Note                                                                                                                                                                                                                               |
|-------------------------------------|--------|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Business name registration (BRS)    | 950    | Likely done                                    | Your terms already state Matobev is a registered business name. Skip if the certificate exists.                                                                                                                                    |
| ODPC data controller registration   | 4,000  | Mandatory                                      | The under-KES-5M turnover exemption <b>does not apply to you</b> . Any organisation processing biometric data must register, and pose estimation on a player's body is biometric processing. Renewal is KES 2,000 every two years. |
| Private company incorporation (BRS) | 10,650 | Recommended                                    | A sole proprietorship puts your personal assets behind a platform holding minors' biometric data. This is the single highest-value legal spend available.                                                                          |
| CR12 certificate                    | 500    | Optional                                       | Needed to open a company bank account.                                                                                                                                                                                             |
| Advocate review — policy and terms  | 40,000 | Recommended                                    | Midpoint of a typical KES 25,000–60,000 range. Both documents carry a "needs legal review" banner for a reason.                                                                                                                    |
| Subtotal                            | 56,100 | 4,950 if you only do what is strictly required |                                                                                                                                                                                                                                    |

## B • Store accounts and domain — one-off / year one

| Item                          | KES    | USD                   | Note                                                                                                                                                   |
|-------------------------------|--------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Google Play developer account | 3,350  | \$25                  | <b>One-off, for life.</b> Requires a physical address, which Play publishes on your listing — the same address still missing from your privacy policy. |
| Apple Developer Program       | 13,266 | \$99/yr               | <b>Recurring every year</b> , and the largest fixed cost in year one. Deferrable if you launch Android first.                                          |
| Domain — matobev.com          | 2,010  | \$15/yr               | Assumes a standard .com renewal. A premium name would cost more.                                                                                       |
| Subtotal                      | 18,626 | 5,360 if Android-only |                                                                                                                                                        |

### THE CHEAPEST REAL DECISION IN THIS BUDGET

**Launching Android first saves KES 13,266 in year one**, and it is the right call on the evidence: your users are on Infinix, itel and Tecno devices running Android Go. iOS can follow once there is revenue to justify the annual fee. That single choice is a fifth of the minimum launch cost.

## C • Running costs — monthly

| Service                        | KES/mo | USD                           | What you get, and why this tier                                                                                                                                 |
|--------------------------------|--------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supabase Pro                   | 3,350  | \$25                          | 8 GB database, <b>100 GB file storage</b> , 250 GB egress. The free tier gives 1 GB of storage, which cannot hold video — this is not an upgrade you can defer. |
| Email on the domain            | 134    | \$1                           | Zoho Mail for support@matobev.com. Google Workspace is ~\$7/user and unnecessary at this stage.                                                                 |
| Sentry — crash reporting       | 0      | free                          | Free tier covers 5,000 errors a month. Already configured and working.                                                                                          |
| Expo EAS — builds              | 0      | free                          | Free tier gives 15 Android and 15 iOS builds a month. The paid Production plan is \$199 and you do not need it.                                                 |
| GitHub Pages — legal documents | 0      | free                          | Already live and serving your privacy policy and terms.                                                                                                         |
| AI analysis compute            | 0      | —                             | <b>Runs on your own machine today.</b> Hosting it becomes a real per-upload cost — see the note below.                                                          |
| Monthly                        | 3,484  | KES 41,808 for the first year |                                                                                                                                                                 |

## D • Launch totals

| Scenario                                                           | One-off | 12 months | Total   |
|--------------------------------------------------------------------|---------|-----------|---------|
| Android only, bare minimum<br>business name + ODPC + Play + domain | 10,310  | 41,808    | 52,118  |
| Android + iOS, bare minimum<br>adds the Apple Developer Program    | 23,576  | 41,808    | 65,384  |
| Recommended<br>incorporated, CR12, advocate review, both stores    | 74,726  | 41,808    | 116,534 |
| Recommended + 15% contingency                                      | —       | —         | 134,014 |

## E • What happens as it grows — the number to watch

Storage is cheap. **Egress is not.** Egress is bandwidth consumed when someone *watches* a video, so it scales with how much the app is used, not with how many people sign up — and every player is free forever.

| Players | Video views/mo | Storage | Egress   | USD/mo | KES/mo |
|---------|----------------|---------|----------|--------|--------|
| 100     | 500            | 8 GB    | 20 GB    | \$25   | 3,350  |
| 500     | 5,000          | 39 GB   | 195 GB   | \$25   | 3,350  |
| 1,000   | 15,000         | 78 GB   | 586 GB   | \$55   | 7,401  |
| 5,000   | 75,000         | 391 GB  | 2,930 GB | \$272  | 36,485 |
| 10,000  | 200,000        | 781 GB  | 7,812 GB | \$720  | 96,471 |

Assumes 40 MB per compressed highlight and two videos per player. Supabase Pro includes 100 GB storage and 250 GB egress; overages are \$0.021/GB for storage and \$0.09/GB for egress.

**THIS IS THE BUDGET'S REAL RISK**

At 10,000 players the bill is roughly **KES 96,000 a month**, and **KES 91,000 of that is people watching videos**. Storage is only about KES 1,900 of it. Success on the player side raises the bill with no revenue attached, because players never pay.

Three mitigations, in order of effect: **compress harder** — 720p at a lower bitrate can halve 40 MB and halves the entire egress column; **put a CDN in front of video** so repeat views are cached rather than re-served; and **price scout subscriptions to cover egress**, since scouts are the ones doing most of the watching.

## F • What this budget does not include

| Not included                | Why, and roughly what it would cost                                                                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Your time                   | The largest real cost by far, and the one a spreadsheet always omits.                                                                                                                       |
| Moderation and verification | The trust positioning depends on a human checking scout documents and handling reports. It cannot be automated away. At any real scale this becomes the biggest line in the budget.         |
| Hosted AI compute           | Analysis runs on your machine today. A small always-on CPU instance is roughly \$20–40/mo (KES 2,700–5,400); per-upload serverless may be cheaper at low volume.                            |
| Marketing and seeding       | Zero here. But a scouting app with thin inventory is not worth opening twice, so getting the first players and scouts onto the platform is the spend that decides whether the rest matters. |
| Apple hardware              | Not needed — EAS builds iOS in the cloud. You only need a Mac if you want a local iOS simulator.                                                                                            |
| Trademark registration      | KIPI trademark filing is roughly KES 5,000–10,000 per class. Worth doing before anyone else registers "Matobev".                                                                            |
| VAT and tax                 | Below the VAT registration threshold there is nothing to remit, but income is still taxable. Speak to an accountant when revenue starts.                                                    |

## G • Recommendation

### WHAT I WOULD ACTUALLY SPEND

**Launch Android only, incorporated, legally reviewed.** That is **KES 103,268** for the first year, or **KES 118,758** with a 15% contingency — and it defers KES 13,266 of Apple fees until there is a reason to pay them.

Of that, **KES 4,000 is genuinely non-negotiable** (ODPC registration, because you process biometric data) and roughly **KES 50,650 is the legal work** — incorporation plus advocate review. That legal spend is not overhead. On a platform holding minors' biometric data, run by a sole proprietor with no corporate veil, it is the cheapest insurance available.

| Order | Spend                             | KES    | When                               |
|-------|-----------------------------------|--------|------------------------------------|
| 1     | ODPC data controller registration | 4,000  | Before launch — legally required   |
| 2     | Google Play developer account     | 3,350  | Before submission                  |
| 3     | Domain + email, year one          | 3,618  | Before launch — support@ must work |
| 4     | Supabase Pro, first month         | 3,350  | Before the first real upload       |
| 5     | Company incorporation + CR12      | 11,150 | Before real user numbers           |
| 6     | Advocate review                   | 40,000 | Before marketing spend             |
| 7     | Apple Developer Program           | 13,266 | Defer until iOS is justified       |

Matobev — Launch Budget · 20 August 2026 · Prepared for Simeon Odhiambo  
Converted at KES 134 = USD 1 (mid-market 129.5 in August 2026, plus a ~3.5% card FX markup). Fees change: verify BRS and ODPC figures on eCitizen and odpc.go.ke before paying.  
Sources: Kenya BRS fee schedule (business name KES 950, private company KES 10,650, CR12 KES 500); ODPC registration regulations (KES 4,000, renewal KES 2,000, mandatory for biometric processing); Google Play (\$25 one-off) and Apple Developer Program (\$99/yr) published fees; Supabase Pro published limits and overage rates; Expo EAS free-tier build allowance.
