

Matobev

Full Product Report

What it is and why it exists. Who it competes with, in detail. How it can sustain itself. Every screen explained. And a design decision with the evidence behind it.

Prepared for Simeon Odhiambo

Scope 44 screens · 23 drawn · 6 competitors · business model

Date 20 August 2026

The five things to know

#	Finding	Detail
1	The concept is not novel	Six direct competitors. Scout Me Pro is near-identical: "TikTok for football", computer-vision scores, 13+ with parental consent, free to start. Afriskaut relaunched in 2025 and is in talks with the NBA. SOCALOCA holds a Ghana FA partnership.
2	AI is table stakes, and Matobev is behind	Every competitor claims AI analysis. Matobev's engine scores four attributes and is <i>low-confidence on all of them</i> . It cannot be the pitch.
3	Trust is the unclaimed position	Fake-agent fraud and player trafficking is a documented, large-scale harm. No competitor positions on safety. Matobev has already built most of what a serious answer requires.
4	There is no business model at all	No payment, subscription or billing code exists anywhere. Not thin — absent. This is the largest unaddressed gap in the product.
5	It has never been used end to end	A ninety-second review surfaced three defects, including a scout being unable to play a player's video at all.

The one-line strategy

Do not compete on AI. Compete on being the platform a parent would let their child use — verified scouts, nobody ever charged, minors protected by default, and ratings that admit when they are unsure. That is defensible, it is what the market lacks, and most of it is already built.

What Matobev is, and why

A talent-discovery platform for African footballers. A player uploads a highlight from their phone; software analyses how they move and produces a rating with a confidence attached; scouts search, watch, shortlist and make contact.

Why it exists

Discovery in African football runs on physical presence and personal networks — being at the right academy, knowing the right person, affording the journey to a trial. Every one of those is a filter on circumstance, not on ability. A gifted seventeen-year-old in Kisumu is not short of talent. They are short of anyone credible watching.

Into that gap steps an organised fraud industry. Fake agents approach young players directly or through social media, promise trials with European clubs, and charge families for "insurance", "registration" or travel. The money is sent and nothing further is heard. In the worst cases players reach Europe, have documents and phones confiscated, and are pressed to extract further payments from home. This is documented at scale by ISS Africa, ENACT and VICE, and the remedy those bodies recommend is always the same: **verification, and publishing who is genuine.**

THE PRODUCT'S ACTUAL BET

If a player can be seen and assessed from a phone video, discovery stops depending on geography and connections. But the rating is not the product. **Being visible to someone real, safely, is the product.** The rating is only the mechanism that makes a stranger worth a scout's attention.

What it actually does

Capability	How it works today
Player profiles	Name, date of birth, nationality, position, physical attributes, club, bio, socials, photo. Four fields required; the rest optional.
Video upload	A clip from the camera roll, as either <i>highlight only</i> or <i>AI analysis</i> . Size checked before transfer; the player tags themselves in one frame so the analysis knows who to follow.
AI analysis	Pose estimation over the clip, producing attribute scores on a 0–99 scale plus an overall — each carrying a confidence of High, Medium or Low earned from sample count and tracking coverage.
Confidence weighting	The overall is weighted by both playing position and measurement confidence, so an uncertain number counts for less.
Scout tools	Filtered search, recommendations with real reasons, saved folders, private notes, side-by-side comparison, direct messaging.
Trials	Scouts post opportunities; players apply; both sides track status.
Safeguarding	Age floor of 13; guardian consent enforced in the database before any analysis of an under-18; under-18 profiles hidden from signed-out visitors; blocking enforced in row-level security; reporting on every surface.
Retention	Profile-view alerts, rating-increase alerts, a Monday digest that stays silent on quiet weeks, and an improvement leaderboard.

Who it serves

Role	Actually wants	Gets	Leaves when
Player 13+, mostly 15–21	Proof someone real is looking	Profile, rating, visibility, trials, evidence of attention	Nothing comes back after an upload
Scout clubs, academies, agents	To avoid wasting a journey	Search, ratings as a first pass, footage, shortlists, notes, contact	Inventory is thin or ratings cannot be trusted
Guardian of an under-18	To know their child is not being exploited	A consent decision they make themselves, and can withdraw	They were never really asked

The guardian never installs the app — they receive a link and decide on a web page. That is the only part of the product designed for someone who is not a user, and the part a regulator looks at first.

The competition, in detail

Six platforms occupy the same sentence as Matobev. Two have institutional backing it does not. One is a near-exact functional twin.

Platform	Positioning	AI claim	Player pays	Scout pays	Minors	Institutional weight
Matobev	African discovery with honest ratings	Pose estimation; 4 attributes; confidence shown	Never — stated in terms	Nothing yet	13+, DB-enforced guardian consent, minors hidden from public	None
Scout Me Pro	"TikTok for football" · <i>Get seen. Get scouted.</i>	Computer vision; strengths, weaknesses, performance score	Free tier; Pro for unlimited uploads and analyses	Free	13+ with parental-consent support	Global, 249 countries
Afriskaut	Scouting, signing and development of African players	Data analytics and technology	Not published	Not published	Not published	Relaunched at Viareggio 2025; NBA discussions
SOCALOCA	Continent-wide football platform	Platform, not AI-led	Not published	Not published	Not published	Ghana FA partnership — default platform in Ghana
ScoutMe	Bridging African players and professional opportunity	Profiles and highlights; transparency-led	Not published	Not published	Not published	Regional
Scoutfutbol	Africa's scouting marketplace — trials, agents, scouts	None claimed	Not published	Not published	Not published	Regional
Wyscout incumbent, pro tier	Professional match data and video for clubs	Data, not consumer AI	N/A	€270/yr individual → ~£3,000/yr enterprise	N/A	Industry standard

Feature by feature

Capability	Matobev	Scout Me Pro	Afriskaut	SOCALOCA	ScoutMe	Scoutfutbol
Vertical short-form video feed	Yes	Yes — core	Unclear	Unclear	Highlights	Highlights
Automated performance rating	Yes	Yes	Analytics	No	No	No
Confidence shown on ratings	Yes	No	No	—	—	—
Refuses comparisons it cannot support	Yes	No	No	—	—	—
Scout verification	Documents reviewed	Claimed	Vetted network	FA-backed	Claimed	Claimed
Guardian consent enforced in the database	Yes	Supported	Unknown	Unknown	Unknown	Unknown
Minors hidden from signed-out visitors	Yes	Unknown	Unknown	Unknown	Unknown	Unknown
Blocking enforced server-side	Row-level security	Unknown	—	—	—	—

Languages	EN-FR-SW-PT	EN	EN-FR	EN	EN	EN
Revenue model live	None	Freemium	B2B	Partnership	Unknown	Unknown

READ THE LAST ROW AGAIN

Matobev wins or draws on nine of thirteen capabilities and leads decisively on the four concerning honesty and child safety. It is alone in the table with **no way to earn a shilling**. Every advantage above is currently unfunded.

Wins on	Loses on	Ties on
Honest ratings with confidence · database-enforced child safety · minors invisible to the public · four languages · never charging players · offline tolerance	No revenue · no partnerships · no inventory · weaker AI · no brand recognition · single operator	Video feed · profiles · search · messaging · trials · verification claims

How Matobev can sustain itself

CURRENT STATE, STATED PLAINLY

There is **no monetisation of any kind in the codebase** — no payment provider, no subscription table, no billing, no plan tiers, no in-app purchase. The word "payment" appears once, in the notice warning players that nobody should ever ask them for money. As it stands Matobev is a cost centre with no revenue path.

The constraint that shapes everything

Matobev's terms state that **players are never charged** — not for the app, not for a trial, not for anything. That is right ethically and competitively, in a market where charging hopeful families is the exact mechanism of the fraud the platform exists to displace. But it permanently removes the largest and most motivated group of users from the revenue equation.

That leaves the demand side: whoever benefits from finding a player. Wyscout proves the willingness to pay exists — €270 a year for an individual scout up to roughly £3,000 for a club — but those are European budgets. A Kenyan academy will not pay them.

Five paths, ranked

#	Model	Who pays	Realistic price	Assessment
1	Tiered scout subscription	Clubs, academies, agents	Regional: \$5–15/mo local · \$40–100/mo European	Best fit. A free tier keeps inventory discoverable; paid unlocks unlimited saves, exports, contact volume and advanced filters. Matches proven willingness to pay while pricing for local reality.
2	Federation & academy partnerships	FAs, academies, NGOs	Annual licence	SOCALOCA proved this works with the Ghana FA. Solves revenue <i>and</i> inventory at once, and confers legitimacy a single operator cannot buy. Slow to close.
3	Verified-scout fee	Scouts wanting a badge	\$50–150 once + renewal	Fits the trust positioning and funds real vetting. Dangerous if it becomes pay-to-look-legitimate — the fee must buy scrutiny, not the badge.
4	Sponsored trials & listings	Clubs, brands	Per listing	Natural fit, but a paid trial listing is exactly the shape a fraudster wants. Only viable once verification is rigorous.
5	Player premium	Players	—	Reject. Contradicts the terms, destroys the differentiator, and monetises the desperation the platform exists to protect. A competitor does this. Matobev should not.

What it costs to run

Cost	Driver	Note
Database & storage	Video volume	The dominant cost, and it scales with success rather than with revenue.
AI analysis compute	Analyses run	Pose estimation is CPU-heavy. Currently local; hosted, it becomes a real per-upload cost.
Push, crash reporting, builds	Users	Modest at current scale.
Moderation & verification	People	The one cost that cannot be automated away – and the one the entire trust positioning depends on.

Recommended model

Free for players, forever, and say so loudly. Free for scouts at a basic tier so inventory stays discoverable. Charge scouts and clubs for volume, export and priority, priced regionally. Pursue one federation or academy partnership as the primary route to both revenue and inventory.

Fund verification from the scout side, so that *being checked* is the thing being paid for. In a market whose defining harm is fake agents, **rigorous verification is simultaneously the product, the differentiator and the revenue line.**

THE UNCOMFORTABLE ECONOMICS

The money is in Europe; the players are in Africa. Any model charging European buyers for access to young African players sits uncomfortably close to the dynamic that enables exploitation. The defence is that the platform is paid for *verification and a safe channel*, never for introductions or transfers, and takes no cut of any deal. That distinction must hold on the pricing page as firmly as it does in the terms.

Every screen

Forty-four screens. Purpose, how each is reached, what it contains, its empty and error states, and the specific thing that can go wrong.

A · Cold start and entry

Splash		native
Holds the first frame while fonts, session and theme resolve, so the app never flashes unstyled content.		
Contains	Logo at 220px; white in light, #0A1628 in dark	
Leads to	Index	
Risk	Dismissed manually once ready. Any failure before that leaves the user staring at a logo with no error and no exit.	

Index — routing gate		index
Decides where a launch lands. No interface of its own.		
Decides	Welcome · onboarding · verify email · profile completion · player tabs · scout tabs · suspended	
Inputs	Session, email-verified flag, role, profile-completed flag, suspension state	
Risk	Every routing bug lands here, and it is the only place a user can be trapped in a loop.	

Welcome		welcome
The entire first impression for a signed-out visitor.		
Contains	Brand, proposition, Create account, Sign in, Browse without an account	
Risk	Currently sells the technology. "Get seen by scouts" outperforms "AI-powered analysis" with this audience.	

Onboarding		onboarding
Three slides: upload, analysis, scouts.		
Risk	Skippable and widely skipped. Nothing load-bearing may live only here.	

Browse — signed out		browse
Shows real players before asking for anything. The strongest and cheapest argument the product can make.		
Contains	Player cards: name, position, country, rating	
Any action	Prompts sign-up with a reason naming the action taken	
Safety	Adults only. Under-18 profiles excluded in the database view, not hidden in the UI	
Risk	With thin inventory this screen argues against the product rather than for it.	

B · Account creation

Role select		role-select
Player or scout. Permanent.		
Risk	The role is immutable in the database. Someone who picks wrong needs a whole new account, so the warning must precede the tap.	

Sign up		signup
Credentials, and acceptance of both legal documents.		
Contains	Email, password, confirm, and two acceptance checkboxes linking to the Terms and Privacy Policy in an in-app browser	
Errors	Duplicate email · weak password · network failure	
Risk	Until recently those links were styled as links and did nothing — people accepted documents they could not open.	

Log in · Forgot password · Verify email		login · forgot-password · verify-email
Return, recover, confirm.		
Risk	Verification-email deliverability is the most common silent drop-off in the entire funnel.	

Profile completion		profile-complete
The four fields the database requires, plus optional depth.		
Required	Full name · date of birth · nationality · primary position	
Optional	Height, weight, club, foot, jersey, years playing, bio, socials, photo	
Age logic	Under 13 blocked; 13–17 flagged for guardian consent	
Risk	The longest form in the app and the last thing before value. Every optional field costs completions.	

C · The player's app

Home		(player-tabs)/home
The player's standing, and the next thing to do. Seen on every launch.		
Contains	Greeting, header actions, rating card, upload prompt, three quick actions, upcoming trials, recent activity	
Loading	Screen-shaped skeleton matching the real layout	
Empty	No rating yet → the card invites a first upload rather than showing a zero	
Risk	The emotional centre of the product, and where a low number does the most damage to a teenager.	

Reels		(player-tabs)/reels
Vertical highlight feed. The habit surface.		
Contains	Full-bleed video, player overlay, like, save, comment, share	
Loading	Spinner rather than a skeleton — grey blocks on black interrupt more than they help	
Risk	By far the most data-hungry screen. Autoplay on mobile data is a spending decision made on the user's behalf.	

Upload (player-tabs)/upload	
The core contribution, and the most expensive action a player takes in real money.	
Steps	Pick clip → highlight or AI analysis → tag yourself in one frame → title, match, opponent, tags → publish
Guards	Size checked before transfer; guardian consent checked before any bytes move; a failed row insert deletes the orphaned file
Risk	Self-tagging is the least obvious step and the one the rating depends on most. Skip it and the number is wrong — and the player blames themselves.
Discover (player-tabs)/discover	
Other players, search, trending, news.	
Empty	No matches → prompt to widen filters
Risk	Player-to-player browsing is social rather than functional and competes with Reels for the same attention. It may not deserve a tab.
Profile — own (player-tabs)/profile	
What a scout sees, plus what is still missing.	
Tabs	About · Videos · AI Ratings · Stats
Contains	Cover, avatar, stat tiles (OVR, reels, views, invites), profile-strength meter, playable videos
Risk	Views and invites are checked obsessively. Held at zero for weeks, this screen actively discourages.
Rating reveal modal	
The single orchestrated moment in the product — the number arriving.	
Contains	Animated badge, overall, provisional count, breakdown CTA; haptics; announced to screen readers
Risk	It celebrates a number the engine may be unsure about. The provisional line must survive every redesign of this screen.
AI ratings ai-ratings	
The full breakdown — the screen that justifies the number.	
Contains	Hero rating, every attribute with value and confidence, job status, recommendations from the real result summary
States	Queued · processing · completed · skipped · failed, each explained rather than coded
Risk	Should be one tap from every place a rating appears. It is the difference between a number and evidence.

D · The scout's app

Dashboard (scout-tabs)/home	
A working surface, not a feed.	
Contains	Verification state, search, overview counts, and four rails — Recommended, Recently Uploaded, Top Performers, Active Trials
Reasons	Recommendations carry a real reason from preferences and activity, never a fabricated one
Risk	Four rails of near-identical cards is a lot of scrolling for little differentiation. Two would likely outperform four.

Players — search		(scout-tabs)/players
Where a scout actually works.		
Filters	Position, age, country, foot, height, weight, minimum rating; sort; compare mode	
Empty	No matches → widen filters	
Risk	With thin inventory, filters return nothing and the app reads as broken rather than empty. Show near-misses instead.	

Trials — scout		(scout-tabs)/trials
Post an opportunity, manage applicants.		
Contains	Trial list; create form with title, club, location, positions, age range, deadline; applicant review	
Risk	A trial post is precisely the shape a fraudster wants. This is where the safety promise is tested hardest.	

Messages · Profile — scout		(scout-tabs)/messages · profile
Contact, and the scout's own record.		
Contains	Conversations with a pinned anti-solicitation notice; organisation, bio, verification badge, saved counts	
Risk	Adult-to-minor messaging is the highest-risk surface in the product and currently has the least friction.	

E · Shared destinations

Player detail		player/[id]
The assessment screen. Every scouting decision is made here.		
Contains	Cover, identity, decision-support disclaimer, overall with confidence, attribute bars, playable footage, save-to-folder, private notes, follow, message, report	
Empty	No videos, or not analysed yet — both stated plainly	
Risk	Until recently the videos were not tappable at all. This screen deserves more testing than any other.	

Compare		compare
Two or more players, attribute by attribute.		
Rule	The "best" highlight is withheld when the winning value is low-confidence	
Risk	Comparison manufactures false precision. Two uncertain numbers look authoritative purely by being adjacent.	

Leaderboard		leaderboard
A ranking someone can actually place in.		
Player scopes	Most improved (default) · region · position · age band	
Scout scopes	Most improved · top rated · matches my filters	
Empty	Scope-aware — "no movement this week" is a different claim from "not enough players"	

Trials list · Trial detail		trials · trial/[id]
Find and apply for opportunities.		
Contains	Open trials, club, location, positions, age range, deadline, requirements, apply, status	
Risk	Every listing needs the "never pay to attend" warning inline. In Help it protects nobody.	

Messages · Notifications · News

messages · notifications · news

Contact, signal, announcements.

Types Scout viewed you · rating went up · weekly digest · trial status · invitation · analysis result · new message · moderation

Behaviour Each routes to its subject; per-category mutes and quiet hours respected

Guardian consent

guardian-consent + web

Where an under-18 asks a parent to approve analysis.

In app Guardian name, email, relationship → generates a link → shared by WhatsApp or SMS

On web The guardian sees the player's name and the exact scopes and confirms. Single-use; the token rotates on use.

Principle A child ticking "my parent agrees" is a child consenting to themselves

Scout verification · Suspended

scout-verification · suspended

Prove you are real; or learn you are no longer welcome.

Risk Verification is the platform's core trust claim. A rubber-stamped badge is worse than no badge, because it launders a stranger.

F · Settings and exit

Settings hub

settings

Everything about the account, and the way out.

Rows Account · Security · Notifications · Privacy · Blocked · Language · Theme · Help — plus **Parent or guardian** for under-18 players

Foot Log out · Delete account

Account · Security · Privacy

account- · security- · privacy-settings

Details, password, visibility, deletion.

Deletion Immediate and irreversible — storage objects removed, rows cascaded. No email, no waiting period, no retention hostage.

Notifications · Blocked · Language · Theme · Help

five settings screens

Control, and the documents.

Notifications Per-category mutes; quiet hours in local time

Blocked Enforced in row-level security — neither party can read the other's rows

Language English · French · Swahili · Portuguese

Help FAQ, safety notice, support email, and both legal documents in an in-app browser

Log out

settings → logout

End the session on this device.

Sequence Unregister this device's push token **first**, while the session still exists → sign out → clear local state → route to Welcome

Why The token delete is scoped to the signed-in profile. After sign-out it is rejected, and the phone keeps receiving the previous account's notifications.

Verdict

Navy and gold. Redraw the mark in one colour.

Primary `#123A6B`. Achievement `#FFC53D`. Ground `#0A1B33`. Green and red stay free for outcomes. Gold appears on exactly one thing — the rating — and is never borrowed for a button.

Every one of the eleven colour pairings this app actually renders passes WCAG AA at normal text size. Not "mostly", not "at large sizes" — **11 of 11**.

Why this and not the alternatives

Option	Case for	Why rejected	Verdict
Keep electric blue <code>#1A6DFF</code>	Already built; no migration cost	It disagrees with the logo by 33°, which is the worst possible distance — close enough to read as a mistake, far enough to clash	No
Match the current teal <code>#00A0B0</code>	Agrees with the existing mark	Fails contrast as text at 3.16 : 1, and the teal does two jobs at once — brand <i>and</i> primary action	No
Pitch green <code>#0B6B3A</code>	Football's own colour; differentiates hard from a market of dark blue apps	Green already means "success" everywhere. This app needs that meaning free for applications, consent and moderation	No
Navy + gold <code>#123A6B</code> · <code>#FFC53D</code>	The register of institutions people trust with children — exactly the position the market leaves open. Gold on navy is the strongest pairing available and it is the trophy language young footballers already read	Navy is common; the <i>mark</i> must carry distinctiveness, which is why it should be redrawn	Recommended

The same card, both ways

Current — cream, deep gold, blue action

Three families competing: warm cream, dark gold, electric blue. The rating does not feel earned because gold-on-cream has nowhere to glow.

Proposed — navy ground, gold rating

Gold at 10.93 : 1 on navy. One colour, one meaning, and the object now looks like something you would screenshot and send to a friend.

The palette, in full

Ground
#0A1B33

Primary
#123A6B

Primary · dark
#7FB0F0

Gold
#FFC53D

Gold · on light
#8A5A00

Success
#1E8449

Error
#C0392B

Muted
#6C7789

Pairing	Ratio	Pairing	Ratio
Primary on white	11.39	Gold on navy	10.93
White on primary	11.39	Gold-dark on white	5.93
Primary-dark on #0B1220	8.35	Muted on white	4.53
Body on white	10.76	Muted-dark on navy	5.98
Success on white	4.72	Error on white	5.44
White on navy card	17.25	11 / 11 pass AA	

THE ONE THING GOLD CANNOT DO

Gold #FFC53D on white is 1.58 : 1 — invisible. Any light surface showing a rating must use #8A5A00 instead. This is the single most likely mistake when applying the palette, because the colour looks fine in a swatch and disappears in use.

On the mark

The two figures and ball is a good silhouette that reads at small sizes. The **gradient is the weak part**: it goes muddy at a 48px launcher icon, forces a light background, and is the reason the app and its own logo currently use different colours. Redrawn as **solid gold on a navy tile**, it survives the launcher, matches the product, and gains the trophy association the rating already depends on.

Retention

A scouting app has a brutal retention shape: a player uploads once, then has nothing to do until something happens *to* them. If nothing does, they leave and never come back. Every design decision below exists to close that gap.

The four returns, and what each depends on

Trigger	The feeling	Design requirement	Status
A scout viewed you	Someone real is looking	Must arrive without naming the scout, and at most once a day or it becomes noise	Built
Your rating went up	The work paid off	Only on a <i>visible</i> change; never on a fall; one message per day that updates as the number climbs	Built
Your week	A rhythm worth keeping	Monday morning local time, and silent when nothing happened	Built
You moved up	Competition you can win	Improvement, not rating, as the default board	Built

THE RULE THAT MAKES THE DIFFERENCE

Never send a hollow notification. A weekly digest that says "0 views, no change" is a weekly reminder that nobody is looking, and it trains people to swipe the app away unread. Silence on a quiet week is what makes the loud weeks mean something.

Three design decisions that do more for retention than any push

1. The rating must look like an object worth owning

This is why gold on navy matters beyond aesthetics. A number in a blue panel is a statistic. The same number in a card with a metal edge is a *possession* — the visual language of a football card, which this audience already reads fluently. People screenshot possessions. They do not screenshot statistics. **The card is the app's only organic growth mechanic.**

2. Progress must be visible before it is impressive

A player rated 25 will never top a rating board and knows it. The improvement board is not a nice extra — it is the only place they can place, and it is why +7 is rendered in green at the same weight as the rating itself. What is measured as progress must be shown as progress.

3. The empty state is the retention surface

A new player has no rating, no views and no rank. That is the moment most of them decide. Every empty state must name the *next action* rather than the absence: "upload a highlight and any gain shows here" rather

than "no data".

WHAT NONE OF THIS FIXES

If a player uploads and **no scout ever views them**, no notification design saves the account. Retention mechanics amplify real activity; they cannot manufacture it. Filling one segment with enough scouts that a view is likely matters more than every screen in this document.

The screens, drawn

Twenty-three screens in the proposed system, in the order a person meets them. Navy carries structure and action; gold appears only on a rating.

Arriving

1 • Splash

Held until fonts and session resolve. Navy in both themes — the first frame already teaches the palette.

Create account

Sign in

Browse without an account

2 • Welcome

Leads with the outcome, not the technology. The third option removes the wall in front of the value.

Upload one clip

We analyse how you move

Next

3 • Onboarding

Three slides. Skippable, so nothing load-bearing lives only here.

4 · Browse (signed out)

Real players before any ask. **Adults only** — under-18 profiles are excluded in the database.

Create account

Free, and always free for players

Password

Confirm password

☐ I accept the [Terms](#)

☐ I accept the [Privacy Policy](#)

Create Player Account

5 · Sign up

Both documents open **in-app**, so reading them does not abandon registration.

Your profile

Step 1 of 3 — the basics

Full name

Date of birth

Country Position

You are under 18, so a parent or guardian must approve AI analysis.

Continue

6 · Profile completion

Only four fields are required. The minor notice appears the moment the date of birth says so.

Being a player

7 · Player home

The card is the hero and the only gold on screen. "A scout viewed your profile" sits directly beneath it.

8 · Rating reveal

The one orchestrated moment. Gold fills the badge here and nowhere else — this is the screenshot.

AI ratings

9 · AI ratings

The screen that justifies the number. Confidence in words **and** colour, never colour alone.

10 · Reels

Full-bleed video, minimal chrome. The rating badge in gold is the only brand colour — everything else gets out of the way.

Upload

AI analysis

Highlight only

↑

Choose a clip

Up to 100 MB · about 40 MB of data

Opponent

Upload & publish

You will tag yourself in the next step

11 · Upload

The data cost is stated **before** the transfer. On metered data that is a courtesy that earns trust.

Leaderboard

Leaderboard				
Most improved				
My region				
My age				
1		Amina K.	+9	41
CM · East Africa				
2		Simeon O.	+7	25
RB · East Africa — you				
3		Kofi A.	+5	38
ST · West Africa				
Compared against last week.				
Upload and any gain shows here.				

12 · Leaderboard

Improvement is the default. **Your own row is highlighted** — the single change that makes a board feel personal.

Being scouted, and scouting

13 · Player detail (scout)
The assessment screen. Footage sits above the attribute detail because watching decides, not reading.

14 · Compare
The bold green marks the winner — **except** where the winning value is low-confidence, where the app refuses to call it.

15 · Scout dashboard
A working surface. The recommendation reason is real, drawn from their own filters — never invented.

16 · Scout search

The rating badge is navy-and-gold at row scale, and the confidence dot rides on it so a soft number is visible while skimming.

Trials

17 · Trials

The anti-fraud warning sits **inline with the listings**, not buried in Help. This is where the harm actually happens.

18 · Messages

The safety notice is pinned above the inbox permanently — not a one-time dismissible tip.

Trust, control, and leaving

Parent or guardian

Because you are under 18, a parent or guardian has to agree before your videos can be analysed.

You can still post highlights without this.

Send them the link

They open the link and decide.
You cannot approve it yourself –
that is the whole point.

Notifications

 **A scout viewed your profile**
Keep your highlights up to date

 **Your rating went up**
Your overall rating is now 25

 **Your week on Matobev**
Rating up 7, and 2 scouts viewed you

Notification settings

Risks and what to do

#	Action	Effort	Why here
1	Walk both roles end to end on a device	1 day	Three defects surfaced in ninety seconds this way. This finds more than any audit I can run.
2	Apply the palette: primary, gold, ground	1–2 days	Three tokens in <code>colors.ts</code> plus the rating card. Removes the brand incoherence across all 44 screens at once.
3	Redraw the mark, solid gold on navy	Designer	The gradient fails at launcher size and forces a light ground. This is the piece I cannot do for you.
4	Highlight the viewer's own row on the leaderboard	Hours	Smallest change with the largest retention effect — a board you are on is a board you return to.
5	Move the anti-fraud warning inline with trials and messages	Hours	It currently sits in Help, which is not where the harm happens.
6	Seed one segment until a view is likely	Ongoing	The real risk. No design fixes an empty marketplace.

The honest bottom line

The engineering is stronger than the product. Access control is enforced in the database, no data is fabricated anywhere, confidence is surfaced rather than hidden, and the child-safety work is genuinely ahead of the market. **None of that is visible to a user in the first ten seconds.**

What is visible is a palette that disagrees with its own logo, a rating that looks like a statistic rather than something earned, and — until this week — a scout who could not press play. Fix the visible layer, then spend everything else on getting enough scouts into one region that a player's upload is actually seen.

Matobev — Design Verdict, Screens & Retention · 20 August 2026 · Prepared for Simeon Odhiambo
Contrast computed with the WCAG 2.1 relative-luminance formula; 11 of 11 rendered pairings pass AA.
Market and safeguarding context: ISS Africa and ENACT (player trafficking); VICE (fake agents); Scout Me Pro, Afriskaut, SOCALOCA, ScoutMe, Scoutfutbol (competing platforms); Google Play "next billion users" (device and data constraints).
